

Environmental Policy

Alexander Mann Solutions recognises that as a global company, our activities have an impact on the environment. As a service provider, our main impacts related to our use of energy and the greenhouse gas emissions that result, as well as the waste we produce and natural resources we consume. We can also have positive environmental impacts through our relationships with responsible suppliers and clients who share our views and aspirations.

We pride ourselves on being a responsible organisation and commit ourselves to continually improving our environmental performance and preventing pollution. We subscribe to the United Nation's Global Compact programme and implement its principles into all our business activities. We support and comply with all environmental legislation and advocate a precautionary approach with regard to environmental concerns.

Our objectives are to reduce our environmental impact by way of:

- Reducing energy use, thereby reducing the greenhouse gas emissions which we are responsible for. We support innovative technical solutions as well as empowering our staff to make real changes
- Minimising our waste by reducing the amount we produce in absolute terms and recycling at all possible opportunities
- Reducing the impact of the goods we procure and natural resources we use through our sustainable purchasing policy
- Using our influence to promote sustainability in both our supply chain and through our relationships with clients and business partners

Detailed objectives and targets are developed on a yearly basis, and monitored to ensure continual improvement.

At Alexander Mann Solutions, our staff are our greatest asset not just in our business operations but also in our drive to improve environmental performance. As a result they are fully involved in our environmental programmes. At a local level, we have a dedicated environmental awareness schemes and support employee led initiatives. Globally, our Global Citizenship Partners champion corporate social responsibility and set specific environmental targets for their regions.

This policy is intended to be sustainable, being integrated into and changing our day-to-day business practices. As such, this policy is communicated to all staff members and is also available to the public.
